

Policy Design and Optimization in Information Sharing

Xin Zhou

x.zhou@uva.nl

Kick off meeting for the DL4LD
Operational Mobility Center case

Systems and Networking Laboratory

27 February, 2020

- My role in the DL4LD project
- Policy design and optimization
- Methodology

My role in the DL4LD project

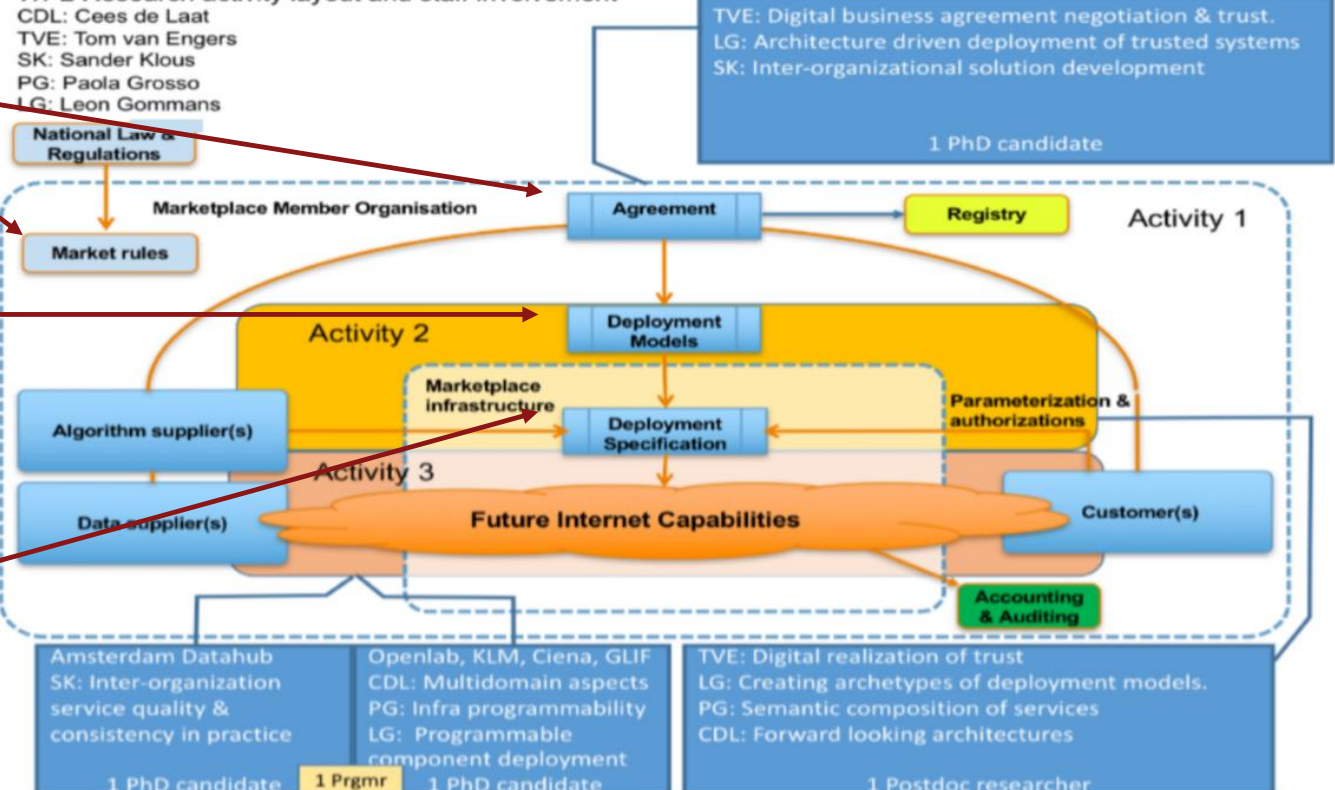

Policy
Strategic level

Planning
Tactical level

Operations
Operational level

WP2 Research activity layout and staff involvement

- What is policy?
 - Specified as **Event-Condition-Action** (ECA) rules that determine the **actions** to be **performed** under certain **situations**
- In ArenA case: Access control policy
 - **Access control policies**: rules that determine permissions on **who** can **perform what on which entities** under **what situations**
 - **Aim: lower down the risks of authorization**

[1] A Policy-based Management Framework for Pervasive Systems using Axiomatized Rule-Actions

[2] An ECA-P Policy-based Framework for Managing Ubiquitous Computing Environments

Risk on:
System security
Data security
...

Risk on:
Individual safety
Public security
...

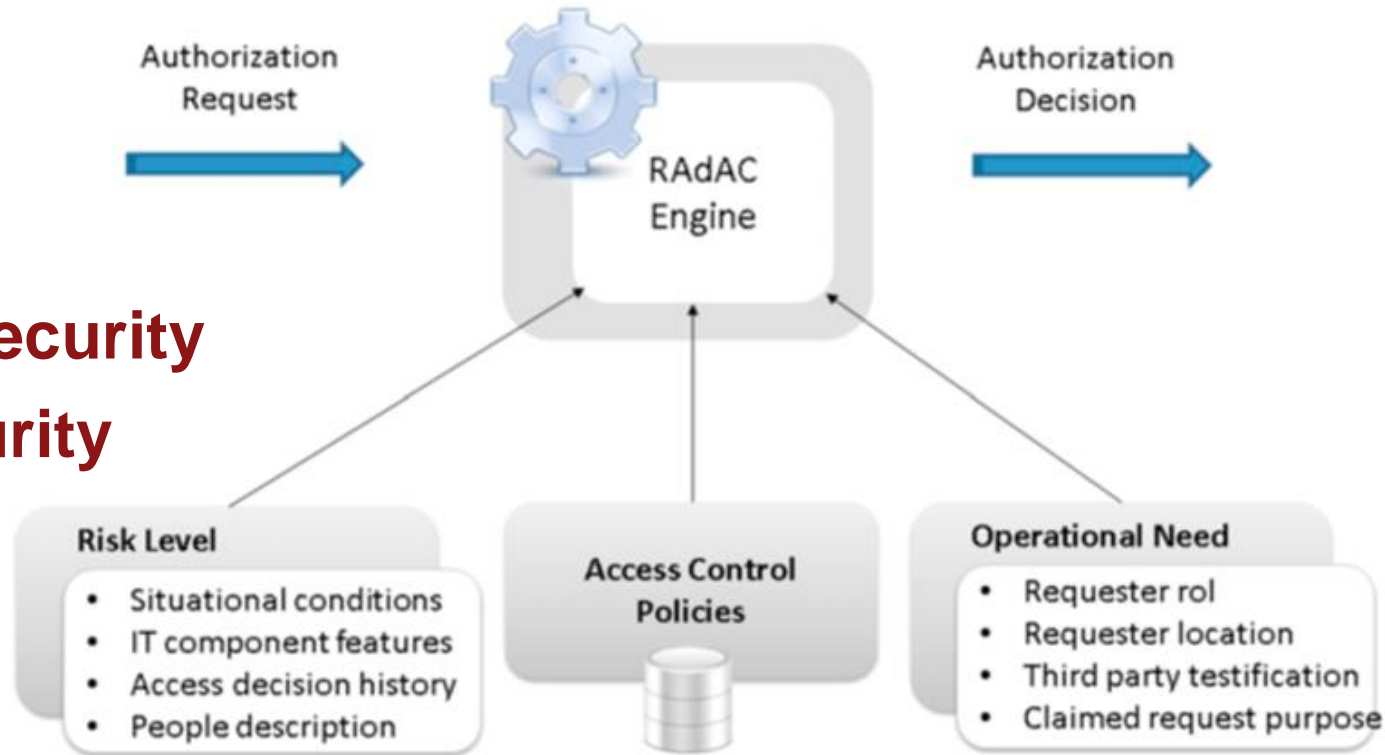

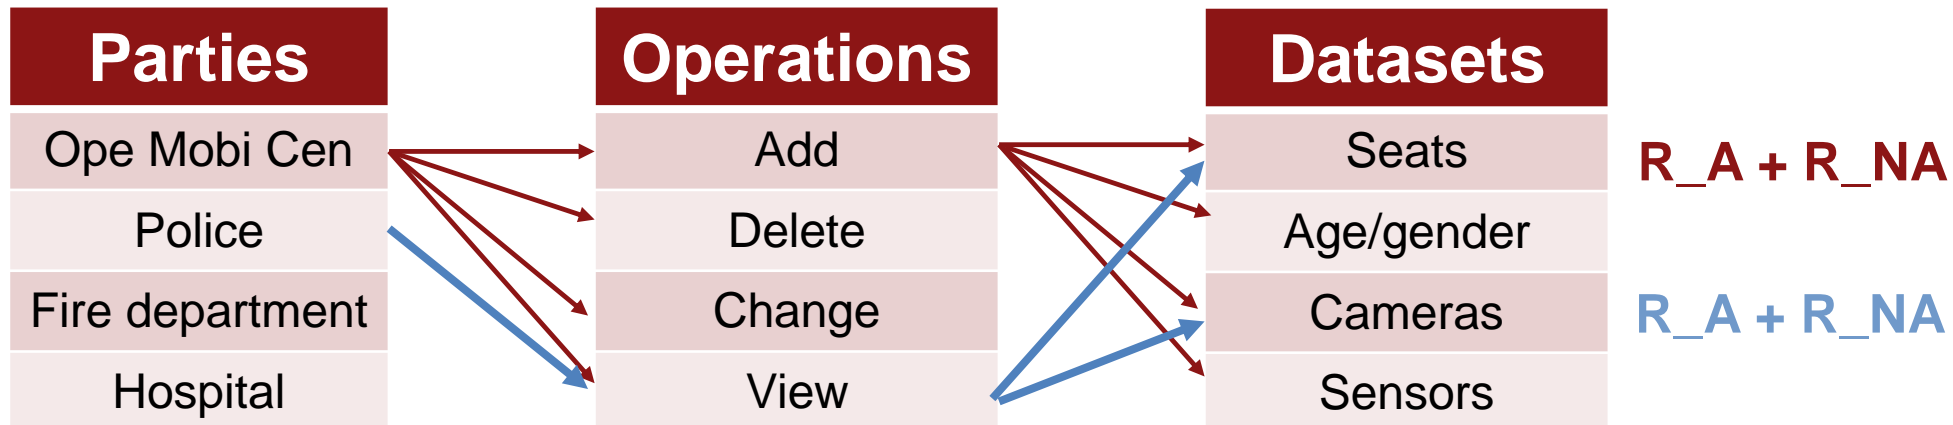

Fig. 1. RAAdAC process model.

[3] Dynamic counter-measures for risk-based access control systems: An evolutionary approach

➤ The calculation about risk

The risk of giving authorization R_A

The risk of NOT giving authorization R_{NA}

- Test and evaluate different policies
- Generate the optimized policy in trade-off
- **Core problem:**

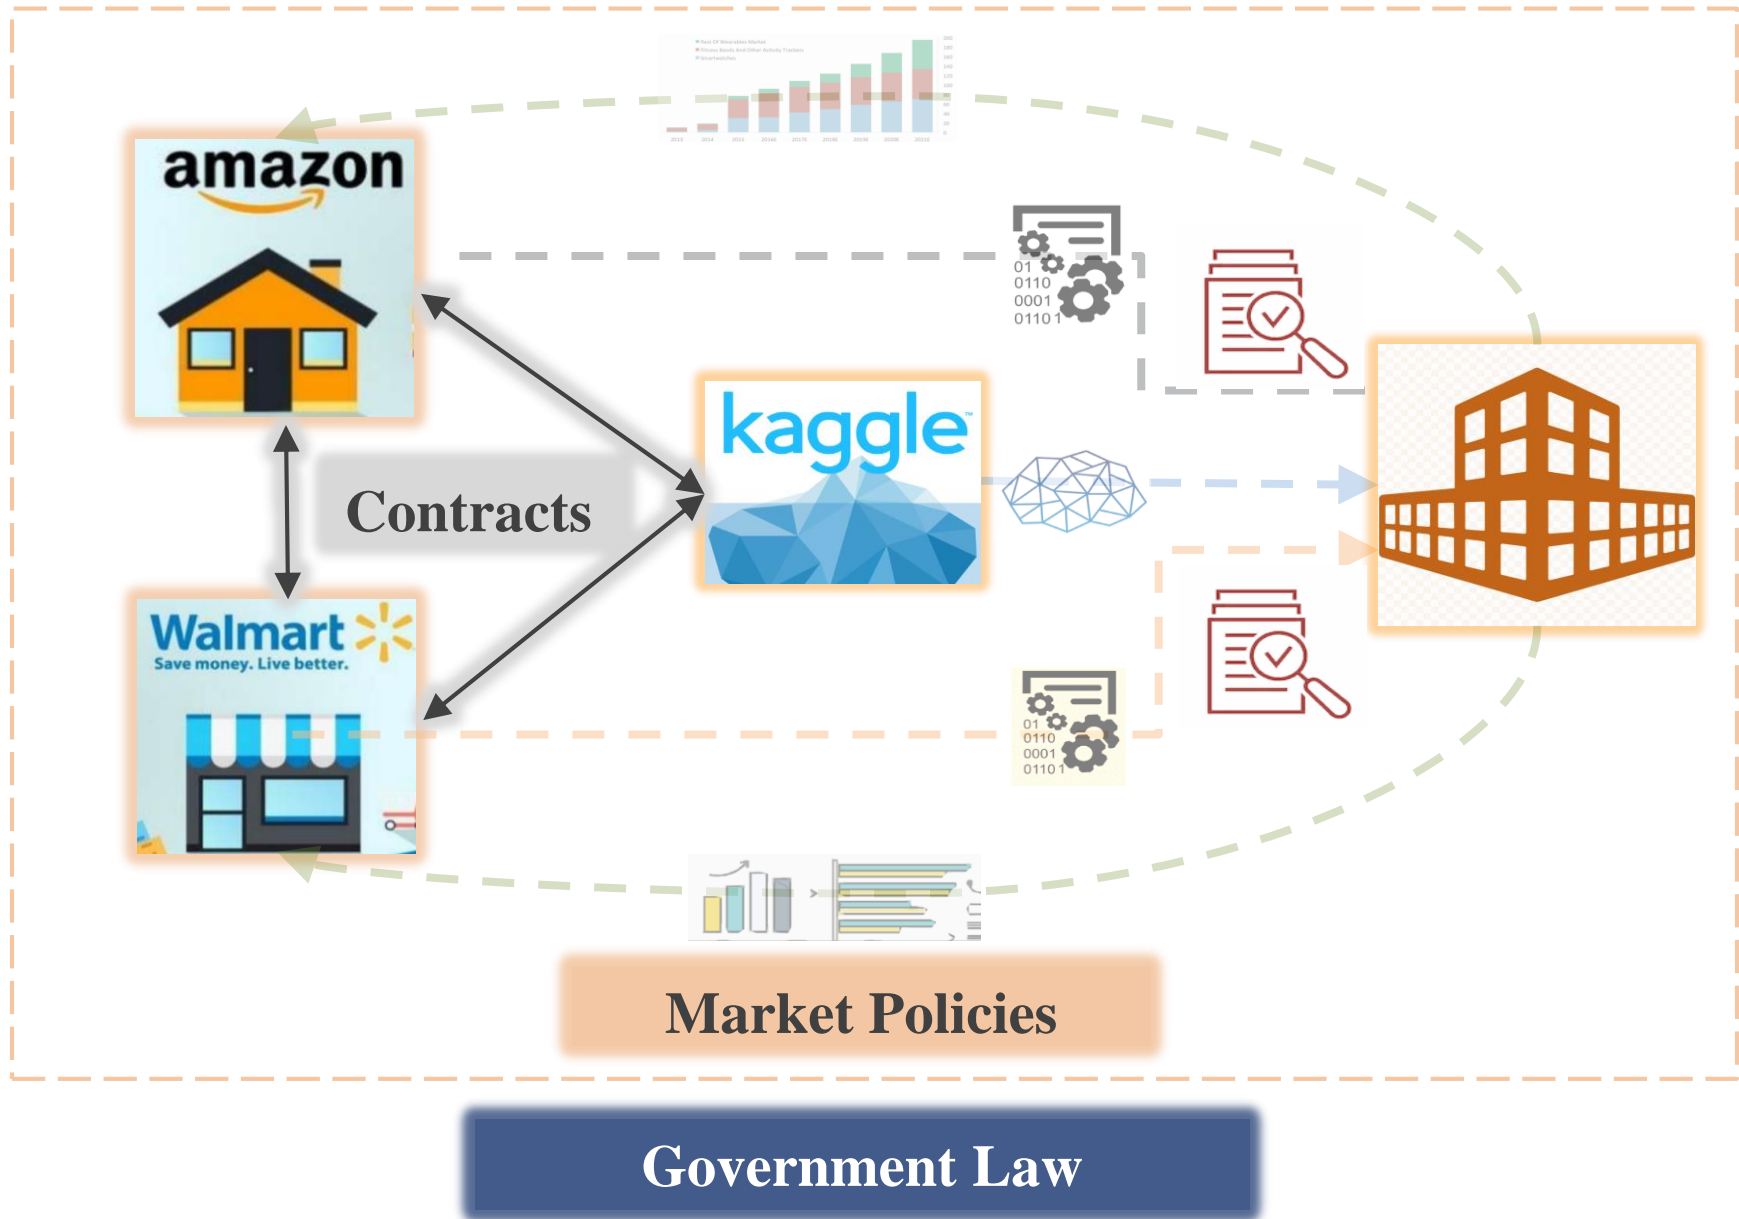

Risk evaluation

$$RL(T_1) = P(T_1|A) \cdot I(T_1)$$

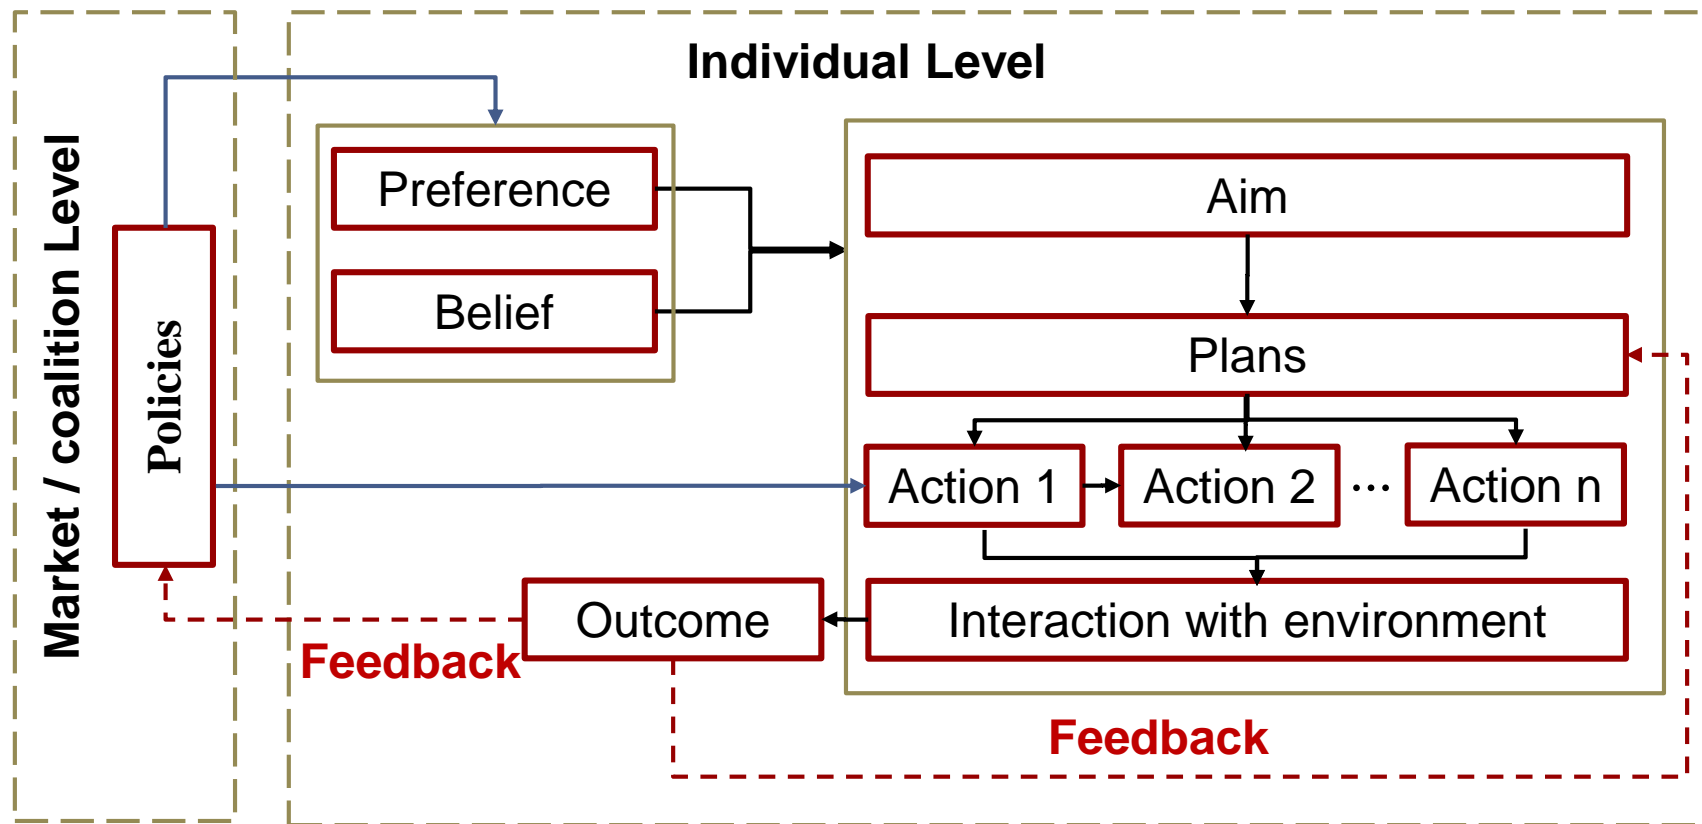

$$RL(T_2) = P(T_2|NA) \cdot I(T_2)$$

quantitative and qualitative (cardinal and ordinal)

Policy design and optimization

- Analytical investigation
- Agent-based modeling
- Simulation experiments
